Introduction 1

Welcome to the Polytope Discord! Here we discuss polytopes, which is a general term that encompasses polygons (2D), polyhedra (3D), polychora (4D), and so on for any dimension.

2 Regular polytopes

There are multiple definitions for when a polytope is regular, but they all require every element (vertices, edges, faces, etc.) to "look the same."

3 Uniform polytopes

Intuitively, a polytope is **uniform** when all of its facets are regular and all of its vertices "look the same." To see what we mean, let's look at a few examples.

- (a) Truncated tetrahedron
- (b) Dodecadodecahedron (c) Snub icosidodecahedron

Figure 1: Three examples of uniform polytopes.

CRF polytopes

A polytope is called **convex regular-faced**, or **CRF** for short, when it is convex (without dents, holes or self-intersections) and all of its faces are regular. Let's look at a few examples.

(b) Hebesphenomegacorona

(c) Disphenocingulum
